

### Enterprise Architecture and Governance

The Enterprise Architecture and Governance practice is designed to help organizations plan and manage their IT investments from a business perspective. Mtell can help you effectively and efficiently ensure that projects across the enterprise are supporting business strategies. With the right Enterprise Architecture and Governance solutions in place, organizations can:

- Align IT spending with business strategy
- Automate project management, resource management and collaboration
- Accelerate business success

Enterprise Architecture and Governance can help you determine the IT projects that support business strategies, those that require additional planning or adjustment and the projects that will not enhance your business and can be eliminated. You will be able to compare projects in terms of strategic intent and outcome, and discover which projects provide the most benefit with the least amount of risk. You'll be able to make strategic decisions using the most up-to-date data without wasting time and resources endlessly generating reports.

Digital dashboards monitor for indications of serious problems before they are able to affect a project. Business unit managers and managers have insight into the same data, enabling them to investigate the causes of poor performance, to fine tune their projects or to determine a change in focus. Digital dashboards are also an integral part of implementing Enterprise Architecture and Governance reforms within an organization because they allow executives to view up-to-the-minute information on all key performance indicators used to define and manage IT value, such as costs, customer satisfaction, project management and total work effort.
